Study Guide: DNA Structure | Biology I

DNA molecules are made of two twisting, paired strands, often referred to as a double helix Each DNA strand is made of four chemical units, called nucleotide bases, which comprise the genetic "alphabet." The bases are adenine (A), thymine (T), guanine (G), and cytosine (C).

Modern Genetics Test Study Guide Draw and describe how genes, DNA, Chromosomes, and nitrogen bases relate to each other. Chromosomes unravel into long DNA strands. Each section of the strand is a gene.

Genetic Test Study Guide

A gene is a part of DNA that contains the instructions that control a trait. You have different genes for each of the different traits that you inherit. Genes Each cell contains 46 chromosomes except for sex cells (eggs and sperm) which contain 23 chromosomes.

Determining mRNA & Gene Sequences - study.com

The study of genetics has gained widespread acclaim in recent times. However, it was only with the discovery of the DNA that a scientific basis for the genes we inherit was established. Both DNA and genes are the most basic building blocks of your body. They determine how your cells are going to behave throughout your life.

The key difference between gene and DNA is that a gene refers to a particular segment of DNA that contains a specific genetic code to produce a protein while DNA is a type of nucleic acid that works as the genetic material of an organism. DNA is a biomolecule. In fact, it is one of the two types of nucleic acids.
