A CRT-D is a small device that combines cardiac resynchronization therapy with defibrillation. It is placed under the skin of the chest. Wires (called “leads”) connect the CRT-D to the heart. A CRT-D is designed to prevent an at-risk person from dying suddenly from a dangerous heart rhythm. CRT-Ds sense dangerous rhythms

Defibrillation is a process in which an electronic device sends an electric shock to the heart to stop an extremely rapid, irregular heartbeat, and restore the normal heart rhythm. Purpose Defibrillation is performed to correct life-threatening fibrillations of the

Epicardial wires allow temporary pacing after cardiac surgery. Pacing is often the best, and sometimes the only method of treating temporary rhythm disturbances in this context. Temporary epicardial pacing has evolved from simple one-chamber systems to dual chamber, biatrial, and even biventricular systems.
