Engine Firing

V12 engines use various different firing orders. In a radial engine, there are always an odd number of cylinders in each bank, as this allows for a constant alternate cylinder firing order: for example, with a single bank of 7 cylinders, the order would be 1-3-5-7-2-4-6. Moreover, unless there is an odd number of cylinders, the ring cam

the main advantages that a V12 engine has over a V8 is that the typical design uses a 60-degree angle, while rarer applications use a 120- or 180-degree angle. This is made possible by the four-stroke firing order which is even in V12 engines.

Normally an engine has more than 3 cylinders. So if we consider the cylinder number C_n on, the the number of combustion per second becomes: And that can be also called: engine first order frequency. There are also second order, third order and so on. With an order number as n ($n=1,2,3\dots$), the engine frequency can be
